Austin Graham

Toronto, ON | (647) 939-8911 | austinmrgraham@gmail.com | github.com/kyoriku | linkedin.com/in/austinmrgraham

Skills

Languages: JavaScript, TypeScript, Python, HTML, CSS, SQL
Frontend: React, TanStack Query, Tailwind CSS, Vitest
Backend: FastAPI, Node.js, Express, SQLAlchemy, pytest
Databases: PostgreSQL, MySQL, Redis
Infrastructure & Tools: Git, Docker, Kubernetes, Cloudflare, Sentry, Linux/Bash, SSH, ADB

Experience

Systems Technician (Hardware-Software Integration), Instacart (Caper AI) – Burlington, ON June 2025 – Present

- Prepared 100+ smart carts for production deployment by running multi-device Bash scripts over ADB and SSH to install APKs, load Docker images, and configure embedded Android and Linux (NVIDIA Jetson) systems
- Traced repeat failures in an internal CLI pipeline to a cleanup step that removed a Kubernetes deployment without restoring it, then recovered affected carts using the tool's own diagnostics until the fix shipped
- As the warehouse's only technical resource since Feb 2026, owned 200+ field device replacements end to end, catching units marked complete that were still mid-update or stuck syncing before shipping
- Partnered with the CLI pipeline's developers through 19 release candidates, testing each build on live carts (186 total), reporting reproducible defects with JSON run logs and repro steps, and verifying fixes on hardware

Projects

Stellar Blade Guide stellarbladeguide.com | github.com/kyoriku/stellar-blade-guide

TypeScript, React, Tailwind CSS, TanStack Query, Python, FastAPI, PostgreSQL, Redis, Cloudflare, OpenAI, Playwright

- Developed and operate an unofficial Stellar Blade game guide with 1,078 collectibles, 95 walkthrough pages and 10k visits in 30 days; every collectible has written directions and a screenshot from 2,800+ original PS5 captures
- Kept Cloudflare's cache warm through content deploys: versioned JSON lands in one transaction per content type, and each purge, recorded before COMMIT, covers only changed API URLs (median 10 of about 130), never images
- Built typo-tolerant search across collectibles, walkthrough sections, levels and type pages: one ranked PostgreSQL query (weighted tsvector, pg_trgm) plus an edit-distance fallback, guarded by a 4,804-query regression harness
- Secured Google and Discord OAuth2 sign-in against login CSRF and unverified-email account takeover; the origin requires a secret header only Cloudflare adds, and PostgreSQL and Redis take no public connections

Expedition 33dle expedition33dle.com | github.com/kyoriku/expedition-33dle

TypeScript, React, Python, FastAPI, SQLAlchemy, PostgreSQL, Alembic, Docker, Cloudflare, pytest, Vitest, Sentry

- Shipped a daily guessing game for Clair Obscur: Expedition 33 with four modes and a 400-entry roster; each day's answer is computed server-side and withheld until a server-validated win or loss
- Ensured no deploy can silently change the published daily answers: a schedule fingerprint asserted at import fails the healthcheck so the prior release stays live; 264-test CI gate, 0 Sentry errors in 30 days of production
- Blocked or challenged 10,000+ requests in 30 days, over 60% of all traffic, via Cloudflare WAF and rate-limit rules written from observed scanner probes, plus pure-ASGI security headers and injection-escaped access logs

Invoice Automation github.com/kyoriku/invoice-automation

Python, Gmail API, Google Sheets API, OAuth2

- Built a Python CLI that automates bi-weekly invoice generation by parsing Gmail schedules via IMAP, calculating hours and HST, and delivering invoices via SMTP, reducing manual invoicing time by 80%
- Integrated Google Sheets and Drive APIs with OAuth2 to populate invoice templates and export PDF/Excel attachments with duplicate shift detection and interactive review before sending

Education

University of Toronto – Certification, Full Stack Web Development March 2024
